Parallel typesetting for critical editions: the ledpar (deprecated) package*

Peter Wilson
Herries Press†
Maïeul Rouquette‡

This is documentation of deprecated ledpar package. If your start your project, we suggest that you use reledpar instead. If for old projects you can't migrate to reledpar, you can continue to use this documentation and the ledpar package.

Abstract

The ledmac package, which is based on the PLAIN TEX set of EDMAC macros, has been used for some time for typesetting critical editions. The ledpar package is an extension to ledmac which enables texts and their critical apparatus to be typeset in parallel, either in two columns or on pairs of facing pages.

To report bugs, please go to ledmac's GitHub page and click "New Issue": `https://github.com/maieul/ledmac/issues/`. You must open an account with github.com to access my page (maieul/ledmac). GitHub accounts are free for open-source users.

You can subscribe to the eledmac email list in: `https://lists.berlios.de/pipermail/ledmac-users/`

List of Figures

1 Introduction

The `EDMAC` macros [LW90] for typesetting critical editions of texts have been available for use with TeX for some years. Since `EDMAC` became available there had been a small but constant demand for a version of `EDMAC` that could be used with LaTeX. The ledmac package was introduced in 2003 in an attempt to satisfy that request.

Some critical editions contain texts in more than one form, such as a set of verses in one language and their translations in another. In such cases there is a desire to be able to typeset the two texts, together with any critical apparatus, in parallel. The ledpar package is an extension to ledmac that enables two texts and their apparatus to be set in parallel, either in two columns or on pairs of facing pages.

The package has to try and coerce TeX into paths it was not designed for. Use of the package, therefore, may produce some surprising results.

This manual contains a general description of how to use ledpar starting in section 2; the complete source code for the package, with extensive documentation

(in sections 8 through 25); and an Index to the source code. As ledpar is an adjunct to ledmac I assume that you have read the ledmac manual. Also ledpar requires ledmac to be used, preferably at least version 0.10 (2011/08/22). You do not need to read the source code for this package in order to use it but doing so may help to answer any questions you might have. On a first reading, I suggest that you should skip anything after the general documentation in sections 2 until 8, unless you are particularly interested in the innards of ledpar.

2   The **ledpar** package

A file may mix *numbered* and *unnumbered* text. Numbered text is printed with marginal line numbers and can include footnotes and endnotes that are referenced to those line numbers: this is how you'll want to print the text that you're editing. Unnumbered text is not printed with line numbers, and you can't use ledmac's note commands with it: this is appropriate for introductions and other material added by the editor around the edited text.

The ledpar package lets you typeset two *numbered* texts in parallel. This can be done either as setting the 'Leftside' and 'Rightside' texts in two columns or on facing pages. In the paired pages case footnotes are placed at the bottom of the page on which they are called out — that is, footnotes belonging to the left are set at the foot of a left (even numbered) page, and those for right texts are at the bottom of the relevant right (odd numbered) page. However, in the columnar case, all footnotes are set at the bottom left of the page on which they are called out — they are not set below the relevant column. The line numbering schemes need not be the same for the two texts.

2.1   General

ledmac essentially puts each chunk of numbered text (the text within a `\pstart` ... `\pend`) into a box and then following the `\pend` extracts the text line by line from the box to number and print it. More precisely, the text is first put into the the box as though it was being typeset as normal onto a page and any notes are stored without being typeset. Then each typeset line is extracted from the box and any notes for that line are recalled. The line, with any notes, is then output for printing, possibly with a line number attached. Effectively, all the text is typeset and then afterwards all the notes are typeset.

ledpar similarly puts the left and right chunks into boxes but can't immediately output the text after a `\pend` — it has to wait until after both the left and right texts have been collected before it can start processing. This means that several boxes are required and possibly TeX has to store a lot of text in its memory; both the number of potential boxes and memory are limited. If TeX's memory is overfilled the recourse is to reduce the amount of text stored before printing.

`\maxchunks`   It is possible to have multiple chunks in the left and right texts before printing them. The macro `\maxchunks{`⟨*num*⟩`}` specifies the maximum number of chunks within the left or right texts. This is initially set as:

```
\maxchunks{10}
```
meaning that there can be up to 10 chunks in the left text and up to 10 chunks in the right text, requiring a total of 20 boxes. If you need more chunks then you can increase \maxchunks. The \maxchunks must be called in the preamble.

TeX has a limited number of boxes; if you get an error message along the lines of 'no room for a new box', then load the package etex, which needs pdflatex or xelatex. If you \maxchunks is too little you can get a ledmac error message along the lines: 'Too many \pstart without printing. Some text will be lost.' then you will have to either increase \maxchunks or use the parallel printing commands (\Columns or \Pages) more frequently.

When typesetting verse using \syntax, each line is treated as a chunk, so be warned that if you are setting parallel verses you might have to increase \maxchunks much more than it appears at first sight.

In general, ledmac is a TeX resource hog, and ledpar only makes things worse in this respect.

3   Parallel columns

pairs   Numbered text that is to be set in columns must be within a `pairs` environment. Within the environment the text for the lefthand and righthand columns is placed within the `Leftside` and `Rightside` environments, respectively; these are described in more detail below in section 5.

\Columns   The command \Columns typesets the texts in the previous pair of `Leftside` and `Rightside` environments. The general scheme for parallel columns looks like this:

```
\begin{pairs}
\begin{Leftside} ... \end{Leftside}
\begin{Rightside} ... \end{Rightside}
\Columns
\begin{Leftside} ... \end{Leftside}
...
\Columns
\end{pairs}
```

There is no required pagebreak before or after the columns.

\Lcolwidth   The lengths \Lcolwidth and \Rcolwidth are the widths of the left and right
\Rcolwidth   columns, respectively. By default, these are:
```
\setlength{\Lcolwidth}{0.45\textwidth}
\setlength{\Rcolwidth}{0.45\textwidth}
```
They may be adjusted if one text tends to be 'bulkier' than the other.

\columnrulewidth   The macro \columnseparator is called between each left/right pair of lines.
\columnseparator   By default it inserts a vertical rule of width \columnrulewidth. As this is initially defined to be 0pt the rule is invisible. For a visible rule between the columns you could try:
```
\setlength{\columnrulewidth}{0.4pt}
```

You can also modify \columnseparator if you want more control. When you use \stanza, the visible rule may shift when a verse has a hanging indent. To prevent shifting, use \setstanzaindents outside the Leftside or Rightside environment.

4   Facing pages

pages   Numbered text that is to be set on facing pages must be within a pages environment. Within the environment the text for the lefthand and righthand pages is placed within the Leftside and Rightside environments, respectively.

\Pages   The command \Pages typesets the texts in the previous pair of Leftside and Rightside environments. The general scheme for parallel pages looks like this:

```
\begin{pages}
\begin{Leftside} ... \end{Leftside}
\begin{Rightside} ... \end{Rightside}
\Pages
\begin{Leftside} ... \end{Leftside}
...
\Pages
\end{pages}
```

The Leftside text is set on lefthand (even numbered) pages and the Rightside text is set on righthand (odd numbered) pages. Each \Pages command starts a new even numbered page. After parallel typesetting is finished, a new page is started.

\Lcolwidth   Within the pages environment the lengths \Lcolwidth and \Rcolwidth are
\Rcolwidth   the widths of the left and right pages, respectively. By default, these are set to the normal textwidth for the document, but can be changed within the environment if necessary.

\goalfraction   When doing parallel pages ledpar has to guess where TeX is going to put pagebreaks and hopefully get there first in order to put the pair of texts on their proper pages. When it thinks that the fraction \goalfraction of a page has been filled, it finishes that page and starts on the other side's text. The definition is:
\newcommand*{\goalfraction}{0.9}
If you think you can get more on a page, increase this. On the other hand, if some left text overflows onto an odd numbered page or some right text onto an even page, try reducing it, for instance by:
\renewcommand*{\goalfraction}{0.8}

5   Left and right texts

Parallel texts are divided into Leftside and Rightside. The form of the contents of these two are independent of whether they will be set in columns or pages.

Leftside   The left text is put within the Leftside environment and the right text like-
Rightside

wise in the `Rightside` environment. The number of `Leftside` and `Rightside` environments must be the same.

Within these environments you can designate the line numbering scheme(s) to be used. The ledmac package originally used counters for specifying the numbering scheme; now both ledmac[1] and the ledpar package use macros instead. Following `\firstlinenum{⟨num⟩}` the first line number will be ⟨num⟩, and following `\linenumincrement{⟨num⟩}` only every ⟨num⟩th line will have a printed number. Using these macros inside the `Leftside` and `Rightside` environments gives you independent control over the left and right numbering schemes. The `\firstsublinenum` and `\sublinenumincrement` macros correspondingly set the numbering scheme for sublines.

In a serial (non-parallel) mode, each numbered paragraph, or chunk, is contained between the `\pstart` and `\pend` macros, and the paragraph is output when the `\pend` macro occurs. The situation is somewhat different with parallel typesetting as the left text (contained within `\pstart` and `\pend` groups within the `Leftside` environment) has to be set in parallel with the right text (contained within its own `\pstart` and `\pend` groups within the corresponding `Rightside` environment) the `\pend` macros cannot immediately initiate any typesetting — this has to be controlled by the `\Columns` or `\Pages` macros. Several chunks may be specified within a `Leftside` or `Rightside` environment. A multi-chunk text then looks like:

```
\begin{...side}
  % \beginnumbering
  \pstart first chunk \pend
  \pstart  second chunk \pend
  ...
  \pstart  last chunk \pend
  % \endnumbering
\end{...side}
```

Numbering, via `\beginnumbering` and `\endnumbering`, may extend across several `Leftside` or `Rightside` environments. Remember, though, that the Left/Right sides are effectively independent of each other.

Generally speaking, controls like `\firstlinenum` or `\linenummargin` apply to sequential and left texts. To effect right texts only they have to be within a `Rightside` environment.

If you are using the babel package with different languages (via, say, `\selectlanguage`) for the left and right texts it is particularly important to select the appropriate language within the `Leftside` and `Rightside` environments. The initial language selected for the right text is the babel package's default. Also, it is the *last* `\selectlanguage` in a side that controls the language used in any notes for that side when they get printed. If you are using multilingual notes then it is probably safest to explicitly specify the language(s) for each note rather than relying on the

---

[1]when used with ledpatch v0.2 or greater.

The marginal notes for this page are: `\firstlinenum`, `\linenumincrement`, `\firstsublinenum`, `\sublinenumincrement`, `\pstart`, `\pend`.

language selection for the side. The right side language is also applied to the right side line numbers.

Corresponding left and right sides must have the same number of paragraph chunks — if there are four on the left there must be four on the right, even if some are empty. The start of each pair of left and right chunks are aligned horizontally on the page. The ends may come at different positions — if one chunk is shorter than the other then blank lines are output on the shorter side until the end of the longer chunk is reached.

6   Numbering text lines and paragraphs

`\beginnumbering` Each section of numbered text must be preceded by `\beginnumbering` and fol-
`\endnumbering`   lowed by `\endnumbering`, like:
`\beginnumbering`
⟨*text*⟩
`\endnumbering`
These have to be separately specified within `Leftside` and `Rightside` environments.

The `\beginnumbering` macro resets the line number to zero, reads an auxiliary file called ⟨*jobname*⟩.`nn` (where ⟨*jobname*⟩ is the name of the main input file for this job, and `nn` is 1 for the first numbered section, 2 for the second section, and so on), and then creates a new version of this auxiliary file to collect information during this run. Separate auxiliary files are unmaintained for right hand texts and these are named ⟨*jobname*⟩.`nnR`, using the 'R' to distinguish them from the left hand and serial (non-parallel) texts.

`\memorydump`   The command `\memorydump` effectively performs an `\endumbering` immediately followed by a `\beginnumbering` while not restarting the numbering sequence. This has the effect of clearing TeX's memory of previous texts and any associated notes, allowing longer apparent streams of parallel texts. The command should be applied to both left and right texts, and after making sure that all previous notes have been output. For example, along the lines of:

```
\begin{Leftside}
  \beginnumbering
  ...
\end{Leftside}
\begin{Rightside}
  \beginnumbering
  ...
\end{Rightside}
\Pages
\begin{Leftside}
  \memorydump
  ...
\end{Leftside}
\begin{Rightside}
  \memorydump
```

...

\Rlineflag   The value of \Rlineflag is appended to the line numbers of the right texts. Its default definition is:

`\newcommand*{\Rlineflag}{R}`

This may be useful for parallel columns but for parallel pages it might be more appropriate to redefine it as:

`\renewcommand*{\Rlineflag}{}`.

\printlinesR   The \printlines macro is ordinarily used to print the line number refer-
\ledsavedprintlines   ences for critical footnotes. For footnotes from right side texts a special version is supplied, called \printlinesR, which incorporates \Rlineflag. (The macro \ledsavedprintlines is a copy of the original \printlines, just in case ...). As provided, the package makes no use of \printlinesR but you may find it useful. For example, if you only use the B footnote series in righthand texts then you may wish to flag any line numbers in those footnotes with the value of \Rlineflag. You could do this by putting the following code in your preamble:

```
\let\oldBfootfmt\Bfootfmt
\renewcommand{\Bfootfmt}[3]{%
  \let\printlines\printlinesR
  \oldBfootfmt{#1}{#2}{#3}}
```

It's possible to insert a number at every \pstart command. You must use
\numberpstarttrue   the \numberpstarttrue command to have it. You can stop the numerotation
\numberpstartfalse   with \numberpstartfalse. You can redefine the commands \thepstartL and
\thepstartL   \thepstartR to change style. The numbering restarts on each \beginnumbering
\thepstartR

7 Verse

If you are typesetting verse with ledmac you can use the \stanza construct, and you can also use this in right or left parallel texts. In this case each verse line is a chunk which has two implications. (1) you can unexpectedly exceed the \maxchunks limit or the overall limit on the number of boxes, and (2) left and right verse lines are matched, which may not be desirable if one side requires more print lines for verse lines than the other does.

astanza   ledpar provides an astanza environment which you can use instead of \stanza (simply replace \stanza by \begin{astanza} and add \end{astanza} after the ending \&). Within the astanza environment each verse line is treated as a paragraph, so there must be no blank lines in the environment otherwise there will be some extraneous vertical spacing.

If you get an error message along the lines of 'Missing number, treated as zero \sza@0@' it is because you have forgotten to use \setstanzaindents to set the stanza indents.

\skipnumbering   The command \skipnumbering when inserted in a line of parallel text causes the numbering of that particular line to be skipped. This can useful if you are

putting some kind of marker (even if it is only a blank line) between stanzas. Remember, parallel texts must be numbered and this provides a way to slip in an 'unnumbered' line.

The `astanza` environment forms a chunk but you may want to have more than one stanza within the chunk. Here are a couple of ways of doing that with a blank line between each internal stanza, and with each stanza numbered. First some preliminary definitions:

```
\newcommand*{\stanzanum}[2][\stanzaindentbase]{%
  \hskip -#1\llap{\textbf{#2}}\hskip #1\ignorespaces}
\newcommand{\interstanza}{\par\mbox{}\skipnumbering}
```

And now for two stanzas in one. In this first example the line numbering repeats for each stanza.

```
\setstanzaindents{1,0,1,0,1,0,1,0,1,0,1}
\begin{pairs}
\begin{Leftside}
  \firstlinenum{2}
  \linenumincrement{1}
  \beginnumbering
  \begin{astanza}
    \stanzanum{1} First in first stanza &
                  Second in first stanza &
                  Second in first stanza &
                  Third in first stanza &
                  Fourth in first stanza &
    \interstanza
    \setline{2}\stanzanum{2} First in second stanza &
                  Second in second stanza &
                  Second in second stanza &
                  Third in second stanza &
                  Fourth in second stanza \&
  \end{astanza}
  ...
```

And here is a slightly different way of doing the same thing, but with the line numbering being continuous.

```
\setstanzaindents{1,0,1,0,1,0,0,1,0,1,0,1}
\begin{pairs}
\begin{Leftside}
  \firstlinenum{2}
  \linenumincrement{1}
  \beginnumbering
  \begin{astanza}
    \stanzanum{1} First in first stanza &
                  Second in first stanza &
                  Second in first stanza &
```

```
                              Third in first stanza &
                              Fourth in first stanza &
               \strut &
               \stanzanum{2}\advanceline{-1} First in second stanza &
                              Second in second stanza &
                              Second in second stanza &
                              Third in second stanza &
                              Fourth in second stanza \&
          \end{astanza}
          ...
```

\hangingsymbol   Like in ledmac, you could redefine the command \hangingsymbol to insert a
                  character in each hanged line. If you use it, you must run LaTeXtwo time. Example
                  for the french typographie

```
\renewcommand{\hangingsymbol}{[\,}
```

8   Implementation overview

TeX is designed to process a single stream of text, which may include footnotes, tables, and so on. It just keeps converting its input into a stream typeset pages. It was not designed for typesetting two texts in parallel, where it has to alternate from one to the other. Further, TeX essentially processes its input one paragraph at a time — it is very difficult to get at the 'internals' of a paragraph such as the individual lines in case you want to number them or put some mark at the start or end of the lines.

ledmac solves the problem of line numbering by putting the paragraph in typeset form into a box, and then extracting the lines one by one from the box for TeX to put them onto the page with the appropriate page breaks. Most of the ledmac code is concerned with handling this box and its contents.

ledpar's solution to the problem of parallel texts is to put the two texts into separate boxes, and then appropriately extract the pairs of lines from the boxes. This involves duplicating much of the original box code for an extra right text box. The other, smaller, part of the code is concerned with coordinating the line extractions from the boxes.

The package code is presented in roughly in the same order as in ledmac.

9   Preliminaries

Announce the name and version of the package, which is targetted for LaTeX2e. The package also requires the ledmac package, preferably at least version 0.13 (2011/11/08).

```
1 ⟨*code⟩
2 \NeedsTeXFormat{LaTeX2e}
3 \ProvidesPackage{ledpar}[2015/07/19 v0.14a ledmac extension for parallel texts]
4
```

With the option 'shiftedverses' a long verse one the left side (or in the right side) don't make a blank on the corresponding verse, but the blank is put on the bottom of the page. Consequently, the verses on the parallel pages are shifted, but the shifted stop at every end of pages.

```
5 \newif\ifshiftedverses
6 \shiftedversesfalse
7 \DeclareOption{shiftedverses}{\shiftedversestrue}
8 \ProcessOptions
```

As noted above, much of the code is a duplication of the original ledmac code to handle the extra box(es) for the right hand side text, and sometimes for the left hand side as well. In order to distinguish I use 'R' or 'L' in the names of macros for the right and left code. The specifics of 'L' and 'R' are normally hidden from the user by letting the `Leftside` and `Rightside` environments set things up appropriately.

\ifl@dpairing \ifl@dpairing is set TRUE if we are processing parallel texts and \ifl@dpaging
\ifl@dpaging is also set TRUE if we are doing parallel pages. \ifledRcol is set TRUE if we
\ifledRcol are doing the right hand text. \ifl@dpairing is defined in ledmac.

```
 9    \l@dpairingfalse
10 \newif\ifl@dpaging
11    \l@dpagingfalse
12    \ledRcolfalse
```

\Lcolwidth The widths of the left and right parallel columns (or pages).
\Rcolwidth
```
13 \newdimen\Lcolwidth
14    \Lcolwidth=0.45\textwidth
15 \newdimen\Rcolwidth
16    \Rcolwidth=0.45\textwidth
17
```

9.1 Messages

All the error and warning messages are collected here as macros.

\led@err@TooManyPstarts

```
18 \newcommand*{\led@err@TooManyPstarts}{%
19    \ledmac@error{Too many \string\pstart\space without printing.
20                  Some text will be lost}{\@ehc}}
```

\led@err@BadLeftRightPstarts

```
21 \newcommand*{\led@err@BadLeftRightPstarts}[2]{%
22    \ledmac@error{The numbers of left (#1) and right (#2)
23                  \string\pstart s do not match}{\@ehc}}
```

\led@err@LeftOnRightPage
\led@err@RightOnLeftPage
```
24 \newcommand*{\led@err@LeftOnRightPage}{%
25    \ledmac@error{The left page has ended on a right page}{\@ehc}}
26 \newcommand*{\led@err@RightOnLeftPage}{%
27    \ledmac@error{The right page has ended on a left page}{\@ehc}}
```

10   Sectioning commands

\section@numR This is the right side equivalent of \section@num.

Each section will read and write an associated 'line-list file', containing infor-
mation used to do the numbering. Normally the file will be called ⟨jobname⟩.nn,
where nn is the section number. However, for right side texts the file is called
⟨jobname⟩.nnR. The \extensionchars applies to the right side files just as it
does to the normal files.

```
28 \newcount\section@numR
29    \section@numR=\z@
```

\ifpst@rtedL   \ifpst@rtedL is set FALSE at the start of left side numbering, and similarly for
\ifpst@rtedR   \ifpst@rtedR. \ifpst@rtedL is defined in ledmac.

```
30     \pst@rtedLfalse
31 \newif\ifpst@rtedR
32     \pst@rtedRfalse
33
```

\beginnumbering   For parallel processing the original \beginnumbering is extended to zero \l@dnumpstartsL
— the number of chunks to be processed. It also sets \ifpst@rtedL to FALSE.

```
34 \providecommand*{\beginnumbering}{%
35     \ifnumbering
36        \led@err@NumberingStarted
37        \endnumbering
38     \fi
39     \global\l@dnumpstartsL \z@
40     \global\pst@rtedLfalse
41     \global\numberingtrue
42     \global\advance\section@num \@ne
43     \initnumbering@reg
44     \message{Section \the\section@num}%
45     \line@list@stuff{\jobname.\extensionchars\the\section@num}%
46     \l@dend@stuff}
```

\beginnumberingR   This is the right text equivalent of \beginnumbering, and begins a section of
numbered text.

```
47 \newcommand*{\beginnumberingR}{%
48     \ifnumberingR
49        \led@err@NumberingStarted
50        \endnumberingR
51     \fi
52     \global\l@dnumpstartsR \z@
53     \global\pst@rtedRfalse
54     \global\numberingRtrue
55     \global\advance\section@numR \@ne
56     \global\absline@numR \z@
57     \global\line@numR \z@
58     \global\@lockR \z@
59     \global\sub@lockR \z@
60     \global\sublines@false
61     \global\let\next@page@numR\relax
62     \global\let\sub@change\relax
63     \message{Section \the\section@numR R }%
64     \line@list@stuffR{\jobname.\extensionchars\the\section@numR R}%
65     \l@dend@stuff
66     \setcounter{pstartR}{1}
67 }
68
```

\endnumbering   This is the left text version of the regular \endnumbering and must follow the last

text for a left text numbered section. It sets `\ifpst@rtedL` to FALSE. It is fully defined in `ledmac`.

`\endnumberingR`   This is the right text equivalent of `\endnumbering` and must follow the last text for a right text numbered section.

```
69 \def\endnumberingR{%
70   \ifnumberingR
71     \global\numberingRfalse
72     \normal@pars
73     \ifl@dpairing
74       \global\pst@rtedRfalse
75     \else
76       \ifx\insertlines@listR\empty\else
77         \global\noteschanged@true
78       \fi
79       \ifx\line@listR\empty\else
80         \global\noteschanged@true
81       \fi
82     \fi
83     \ifnoteschanged@
84       \led@mess@NotesChanged

11   Line counting

11.1   Choosing the system of lineation

Sometimes you want line numbers that start at 1 at the top of each page; sometimes you want line numbers that start at 1 at each \pstart; other times you want line numbers that start at 1 at the start of each section and increase regardless of page breaks. ledpar lets you choose different schemes for the left and right texts.

\ifbypstart@R The \ifbypage@R and \ifbypstart@R flag specifie the current lineation system:
\bypstart@Rtrue
\bypstart@Rfalse
\ifbypage@R   • line-of-page : bypstart@R = false and bypage@R = true.
\bypage@Rtrue
\bypage@Rfalse   • line-of-pstart : bypstart@R = true and bypage@R = false.

ledpar will use the line-of-section system unless instructed otherwise.

```
122 \newif\ifbypage@R
123 \newif\ifbypstart@R
124    \bypage@Rfalse
125    \bypstart@Rfalse
```

\lineationR \lineationR{⟨*word*⟩} is the macro used to select the lineation system for right texts. Its argument is a string: either page, pstart or section.

```
126 \newcommand*{\lineationR}[1]{{%
127    \ifnumbering
128       \led@err@LineationInNumbered
129    \else
130       \def\@tempa{#1}\def\@tempb{page}%
131       \ifx\@tempa\@tempb
132          \global\bypage@Rtrue
133          \global\bypstart@Rfalse
134       \else
135          \def\@tempb{pstart}%
```

```
136        \ifx\@tempa\@tempb
137           \global\bypage@Rfalse
138           \global\bypstart@Rtrue
139        \else
140         \def@tempb{section}
141         \ifx\@tempa\@tempb
142           \global\bypage@Rfalse
143           \global\bypstart@Rfalse
144         \else
145           \led@warn@BadLineation
146         \fi
147        \fi
148     \fi
149   \fi}}
```

\linenummargin   You call \linenummargin{⟨word⟩} to specify which margin you want your right
\line@marginR   text's line numbers in; it takes one argument, a string. You can put the line
                  numbers in the same margin on every page using left or right; or you can use
                  inner or outer to get them in the inner or outer margins. You can change this
                  within a numbered section, but the change may not take effect just when you'd
                  like; if it's done between paragraphs nothing surprising should happen.

                      For right texts the selection is recorded in the count \line@marginR, otherwise
                  in the count \line@margin: 0 for left, 1 for right, 2 for outer, and 3 for inner.

```
150 \newcount\line@marginR
151 \renewcommand*{\linenummargin}[1]{{%
152   \l@dgetline@margin{#1}%
153   \ifnum\@l@dtempcntb>\m@ne
154     \ifledRcol
155       \global\line@marginR=\@l@dtempcntb
156     \else
157       \global\line@margin=\@l@dtempcntb
158     \fi
159   \fi}}
```

By default put right text numbers at the right.

```
160 \line@marginR=\@ne
161
```

\c@firstlinenumR   The following counters tell ledmac which right text lines should be printed with
\c@linenumincrementR line numbers. firstlinenum is the number of the first line in each section that
                      gets a number; linenumincrement is the difference between successive numbered
                      lines. The initial values of these counters produce labels on lines 5, 10, 15, etc.
                      linenumincrement must be at least 1.

```
162 \newcounter{firstlinenumR}
163   \setcounter{firstlinenumR}{5}
164 \newcounter{linenumincrementR}
165   \setcounter{linenumincrementR}{5}
```

`\c@firstsublinenumR` The following parameters are just like `firstlinenumR` and `linenumincrementR`,
`\c@sublinenumincrementR` but for sub-line numbers. `sublinenumincrementR` must be at least 1.

```
166 \newcounter{firstsublinenumR}
167   \setcounter{firstsublinenumR}{5}
168 \newcounter{sublinenumincrementR}
169   \setcounter{sublinenumincrementR}{5}
170
```

`\firstlinenum` These are the user's macros for changing (sub) line numbers. They are defined in
`\linenumincrement` ledmac v0.7, but just in case I have started by `\provide`ing them.
`\firstsublinenum`
`\sublinenumincrement`
```
171 \providecommand*{\firstlinenum}{}
172 \providecommand*{\linenumincrement}{}
173 \providecommand*{\firstsublinenum}{}
174 \providecommand*{\sublinenumincrement}{}
175 \renewcommand*{\firstlinenum}[1]{%
176   \ifledRcol \setcounter{firstlinenumR}{#1}%
177   \else       \setcounter{firstlinenum}{#1}%
178   \fi}
179 \renewcommand*{\linenumincrement}[1]{%
180   \ifledRcol \setcounter{linenumincrementR}{#1}%
181   \else       \setcounter{linenumincrement}{#1}%
182   \fi}
183 \renewcommand*{\firstsublinenum}[1]{%
184   \ifledRcol \setcounter{firstsublinenumR}{#1}%
185   \else       \setcounter{firstsublinenum}{#1}%
186   \fi}
187 \renewcommand*{\sublinenumincrement}[1]{%
188   \ifledRcol \setcounter{sublinenumincrementR}{#1}%
189   \else       \setcounter{sublinenumincrement}{#1}%
190   \fi}
191
```

`\Rlineflag` This is appended to the line numbers of right text.
```
192 \newcommand*{\Rlineflag}{R}
193
```

`\linenumrepR` `\linenumrepR{⟨ctr⟩}` typesets the right line number ⟨ctr⟩, and similarly `\sublinenumrepR`
`\sublinenumrepR` for subline numbers.
```
194 \newcommand*{\linenumrepR}[1]{\@arabic{#1}}
195 \newcommand*{\sublinenumrepR}[1]{\@arabic{#1}}
196
```

`\leftlinenumR` `\leftlinenumR` and `\rightlinenumR` are the macros that are called to print the
`\rightlinenumR` right text's marginal line numbers. Much of the code for these is common and is
`\l@dlinenumR` unmaintained in `\l@dlinenumR`.
```
197 \newcommand*{\leftlinenumR}{%
198   \l@dlinenumR
199   \kern\linenumsep}
```

```
200 \newcommand*{\rightlinenumR}{%
201   \kern\linenumsep
202   \l@dlinenumR}
203 \newcommand*{\l@dlinenumR}{%
204   \numlabfont\linenumrepR{\line@numR}\Rlineflag%
205   \ifsublines@
206     \ifnum\subline@num>\z@
207       \unskip\fullstop\sublinenumrepR{\subline@numR}%
208     \fi
209   \fi}
210
```

11.2 Line-number counters and lists

We need another set of counters and lists for the right text, corresponding to those in ledmac for regualr or left text.

\line@numR   The count `\line@numR` stores the line number that's used in the right text's
\subline@numR marginal line numbering and in notes. The count `\subline@numR` stores a sub-line
\absline@numR number that qualifies `\line@numR`. The count `\absline@numR` stores the absolute
number of lines since the start of the right text section: that is, the number we've
actually printed, no matter what numbers we attached to them.

```
211 \newcount\line@numR
212 \newcount\subline@numR
213 \newcount\absline@numR
214
```

\line@listR   Now we can define the list macros that will be created from the line-list file. They
\insertlines@listR are directly analagous to the left text ones. The full list of action codes and their
\actionlines@listR meanings is given in the ledmac manual.
\actions@listR   Here are the commands to create these lists:

```
215 \list@create{\line@listR}
216 \list@create{\insertlines@listR}
217 \list@create{\actionlines@listR}
218 \list@create{\actions@listR}
219
```

\linesinpar@listL   In order to synchonise left and right chunks in parallel processing we need to know
\linesinpar@listR   how many lines are in each left and right text chunk, and the maximum of these
\maxlinesinpar@list for each pair of chunks.

```
220 \list@create{\linesinpar@listL}
221 \list@create{\linesinpar@listR}
222 \list@create{\maxlinesinpar@list}
223
```

\page@numR   The right text page number.

```
224 \newcount\page@numR
225
```

11.3   Reading the line-list file

\read@linelist   \read@linelist{⟨*file*⟩} is the control sequence that's called by \beginnumbering
(via \line@list@stuff) to open and process a line-list file; its argument is the
name of the file.

```
226 \renewcommand*{\read@linelist}[1]{%
```

We do do different things depending whether or not we are processing right text

```
227   \ifledRcol
228     \list@clear{\line@listR}%
229     \list@clear{\insertlines@listR}%
230     \list@clear{\actionlines@listR}%
231     \list@clear{\actions@listR}%
232     \list@clear{\linesinpar@listR}%
233     \list@clear{\linesonpage@listR}
234   \else
235     \list@clearing@reg
236     \list@clear{\linesinpar@listL}%
237     \list@clear{\linesonpage@listL}%
238   \fi
```

Make sure that the \maxlinesinpar@list is empty (otherwise things will be
thrown out of kilter if there is any old stuff still hanging in there).

```
239   \list@clear{\maxlinesinpar@list}
```

Now get the file and interpret it.

```
240   \get@linelistfile{#1}%
241   \endgroup
```

When the reading is done, we're all through with the line-list file. All the
information we needed from it will now be encoded in our list macros. Finally, we
initialize the \next@actionline and \next@action macros, which specify where
and what the next action to be taken is.

```
242   \ifledRcol
243     \global\page@numR=\m@ne
244     \ifx\actionlines@listR\empty
245       \gdef\next@actionlineR{1000000}%
246     \else
247       \gl@p\actionlines@listR\to\next@actionlineR
248       \gl@p\actions@listR\to\next@actionR
249     \fi
250   \else
251     \global\page@num=\m@ne
252     \ifx\actionlines@list\empty
253       \gdef\next@actionline{1000000}%
254     \else
255       \gl@p\actionlines@list\to\next@actionline
256       \gl@p\actions@list\to\next@action
257     \fi
258   \fi}
259
```

This version of `\read@linelist` creates list macros containing data for the entire section, so they could get rather large. The `\memorydump` macro is available if you run into macro memory limitations.

11.4   Commands within the line-list file

This section defines the commands that can appear within a line-list file, except for `\@lab` which is in a later section among the cross-referencing commands it is associated with.

The macros with `action` in their names contain all the code that modifies the action-code list.

`\@l@regR`   `\@l` does everything related to the start of a new line of numbered text. Exactly
`\@l`   what it does depends on whether right text is being processed.

```
260 \newcommand{\@l@regR}{%
261   \ifx\l@dchset@num\relax \else
262     \advance\absline@numR \@ne
263     \set@line@action
264     \let\l@dchset@num\relax
265     \advance\absline@numR \m@ne
266     \advance\line@numR \m@ne%   % do we need this?
267   \fi
268   \advance\absline@numR \@ne
269   \ifx\next@page@numR\relax \else
270     \page@action
271     \let\next@page@numR\relax
272   \fi
273   \ifx\sub@change\relax \else
274     \ifnum\sub@change>\z@
275       \sublines@true
276     \else
277       \sublines@false
278     \fi
279     \sub@action
280     \let\sub@change\relax
281   \fi
282   \ifcase\@lockR
283   \or

\n@num   This macro implements the \skipnumbering command. It uses a new action code,
              namely 1007.

```
507 \providecommand*{\n@num}{}
508 \renewcommand*{\n@num}{%
509   \ifledRcol
510     \xright@appenditem{\the\absline@numR}\to\actionlines@listR
511     \xright@appenditem{-1007}\to\actions@listR
512   \else
```

```
513      \n@num@reg
514   \fi}
515
```

\@ref marks the start of a passage, for creation of a footnote reference. It takes two arguments:

- #1, the number of entries to add to \insertlines@list for this reference. This value for right text, here and within \edtext, which computes it and writes it to the line-list file, will be stored in the count \insert@countR.

```
516      \newcount\insert@countR
```

- #2, a sequence of other line-list-file commands, executed to determine the ending line-number. (This may also include other \@ref commands, corresponding to uses of \edtext within the first argument of another instance of \edtext.)

The first thing \@ref itself does is to add the specified number of items to the \insertlines@list list.

```
517 \renewcommand*{\@ref}[2]{%
518   \ifledRcol
519      \global\insert@countR=#1\relax
520      \loop\ifnum\insert@countR>\z@
521         \xright@appenditem{\the\absline@numR}\to\insertlines@listR
522         \global\advance\insert@countR \m@ne
523      \repeat
```

Next, process the second argument to determine the page and line numbers for the end of this lemma. We temporarily equate \@ref to a different macro that just executes its argument, so that nested \@ref commands are just skipped this time. Some other macros need to be temporarily redefined to suppress their action.

```
524   \begingroup
525      \let\@ref=\dummy@ref
526      \let\page@action=\relax
527      \let\sub@action=\relax
528      \let\set@line@action=\relax
529      \let\@lab=\relax
530      #2
531      \global\endpage@num=\page@numR
532      \global\endline@num=\line@numR
533      \global\endsubline@num=\subline@numR
534   \endgroup
```

Now store all the information about the location of the lemma's start and end in \line@list.

```
535      \xright@appenditem%
536         {\the\page@numR|\the\line@numR|%
537          \ifsublines@ \the\subline@numR \else 0\fi|%
538          \the\endpage@num|\the\endline@num|%
539          \ifsublines@ \the\endsubline@num \else 0\fi}\to\line@listR
```

Finally, execute the second argument of `\@ref` again, to perform for real all the commands within it.

```
540    #2
541    \else
```

And when not in right text

```
542      \@ref@reg{#1}{#2}%
543    \fi}
```

\@pend   `\@pend{⟨num⟩}` adds its argument to the `\linesinpar@listL` list, and analagously
\@pendR   for `\@pendR`. If needed, it resets line number. We start off with a `\providecommand`
            just in case an older version of ledmac is being used which does not define these
            macros.

```
544 \providecommand*{\@pend}[1]{}
545 \renewcommand*{\@pend}[1]{%
546    \ifbypstart@\global\line@num=0\fi%
547    \xright@appenditem{#1}\to\linesinpar@listL}
548 \providecommand*{\@pendR}[1]{}
549 \renewcommand*{\@pendR}[1]{%
550    \ifbypstart@R\global\line@numR=0\fi%
551    \xright@appenditem{#1}\to\linesinpar@listR}
552
```

\@lopL   `\@lopL{⟨num⟩}` adds its argument to the `\linesonpage@listL` list, and analagously
\@lopR   for `\@lopR`. We start off with a `\providecommand` just in case an older version of
            ledmac is being used which does not define these macros.

```
553 \providecommand*{\@lopL}[1]{}
554 \renewcommand*{\@lopL}[1]{%
555    \xright@appenditem{#1}\to\linesonpage@listL}
556 \providecommand*{\@lopR}[1]{}
557 \renewcommand*{\@lopR}[1]{%
558    \xright@appenditem{#1}\to\linesonpage@listR}
559
```

11.5   Writing to the line-list file

We've now defined all the counters, lists, and commands involved in reading the line-list file at the start of a section. Now we'll cover the commands that ledmac uses within the text of a section to write commands out to the line-list.

\linenum@outR   The file for right texts will be opened on output stream `\linenum@outR`.

```
560 \newwrite\linenum@outR
```

\iffirst@linenum@out@R   Once any file is opened on this stream, we keep it open forever, or else switch to
\first@linenum@out@Rtrue   another file that we keep open.
\first@linenum@out@Rfalse

```
561 \newif\iffirst@linenum@out@R
562    \first@linenum@out@Rtrue
```

\line@list@stuffR   This is the right text version of the \line@list@stuff{⟨*file*⟩} macro. It is called
by \beginnumberingR and performs all the line-list operations needed at the start
of a section. Its argument is the name of the line-list file.

```
563 \newcommand*{\line@list@stuffR}[1]{%
564   \read@linelist{#1}%
565   \iffirst@linenum@out@R
566     \immediate\closeout\linenum@outR
567     \global\first@linenum@out@Rfalse
568     \immediate\openout\linenum@outR=#1
569   \else
570     \closeout\linenum@outR
571     \openout\linenum@outR=#1
572   \fi}
573
```

\new@lineR   The \new@lineR macro sends the \@l command to the right text line-list file, to
mark the start of a new text line.

```
574 \newcommand*{\new@lineR}{%
575   \write\linenum@outR{\string\@l[\the\c@page][\thepage]}}
```

\flag@start   We enclose a lemma marked by \edtext in \flag@start and \flag@end: these
\flag@end   send the \@ref command to the line-list file.

```
576 \renewcommand*{\flag@start}{%
577   \ifledRcol
578     \edef\next{\write\linenum@outR{%
579                   \string\@ref[\the\insert@countR][}}%
580     \next
581   \else
582     \edef\next{\write\linenum@out{%
583                   \string\@ref[\the\insert@count][}}%
584     \next
585   \fi}
586 \renewcommand*{\flag@end}{%
587   \ifledRcol
588     \write\linenum@outR{]}%
589   \else
590     \write\linenum@out{]}%
591   \fi}
```

\startsub   \startsub and \endsub turn sub-lineation on and off, by writing appropriate
\endsub   instructions to the line-list file.

```
592 \renewcommand*{\startsub}{\dimen0\lastskip
593   \ifdim\dimen0>0pt \unskip \fi
594   \ifledRcol \write\linenum@outR{\string\sub@on}%
595   \else       \write\linenum@out{\string\sub@on}%
596   \fi
597   \ifdim\dimen0>0pt \hskip\dimen0 \fi}
598 \def\endsub{\dimen0\lastskip
599   \ifdim\dimen0>0pt \unskip \fi
```

```
600    \ifledRcol \write\linenum@outR{\string\sub@off}%
601    \else      \write\linenum@out{\string\sub@off}%
602    \fi
603    \ifdim\dimen0>0pt \hskip\dimen0 \fi}
604
```

\advanceline You can use \advanceline{⟨num⟩} in running text to advance the current visible
             line-number by a specified value, positive or negative.

```
605 \renewcommand*{\advanceline}[1]{%
606    \ifledRcol \write\linenum@outR{\string\@adv[#1]}%
607    \else      \write\linenum@out{\string\@adv[#1]}%
608    \fi}
```

\setline You can use \setline{⟨num⟩} in running text (i.e., within \pstart...\pend) to
         set the current visible line-number to a specified positive value.

```
609 \renewcommand*{\setline}[1]{%
610    \ifnum#1<\z@
611       \led@warn@BadSetline
612    \else
613       \ifledRcol \write\linenum@outR{\string\@set[#1]}%
614       \else      \write\linenum@out{\string\@set[#1]}%
615       \fi
616    \fi}
```

\setlinenum You can use \setlinenum{⟨num⟩} before a \pstart to set the visible line-number
            to a specified positive value. It writes a \l@d@set command to the line-list file.

```
617 \renewcommand*{\setlinenum}[1]{%
618    \ifnum#1<\z@
619       \led@warn@BadSetlinenum
620    \else
621       \ifledRcol \write\linenum@outR{\string\l@d@set[#1]}
622       \else      \write\linenum@out{\string\l@d@set[#1]} \fi
623    \fi}
624
```

\startlock You can use \startlock or \endlock in running text to start or end line number
\endlock   locking at the current line. They decide whether line numbers or sub-line numbers
           are affected, depending on the current state of the sub-lineation flags.

```
625 \renewcommand*{\startlock}{%
626    \ifledRcol \write\linenum@outR{\string\lock@on}%
627    \else      \write\linenum@out{\string\lock@on}%
628    \fi}
629 \def\endlock{%
630    \ifledRcol \write\linenum@outR{\string\lock@off}%
631    \else      \write\linenum@out{\string\lock@off}%
632    \fi}
633
```

\skipnumbering In numbered text, `\skipnumbering` in a line will suspend the numbering for that particular line. That is, line numbers are unchanged and no line number will be printed.

```
634 \renewcommand*{\skipnumbering}{%
635   \ifledRcol \write\linenum@outR{\string\n@num}%
636           \advanceline{-1}%
637   \else
638     \skipnumbering@reg
639   \fi}
640
```

12   Marking text for notes

The `\edtext` (or `\critext`) macro is used to create all footnotes and endnotes, as well as to print the portion of the main text to which a given note or notes is keyed. The idea is to have that lemma appear only once in the `.tex` file: all instances of it in the main text and in the notes are copied from that one appearance.

`\critext` requires two arguments. At any point within numbered text, you use it by saying:

```
\critext{#1}#2/
```

Similarly `\edtext` requires the same two arguments but you use it by saying:

```
\edtext{#1}{#2}
```

\critext Now we begin `\critext` itself.

We slightly modify the original to make accomodation for when right text is being processed.

```
641 \long\def\critext#1#2/{\leavevmode
642   \begingroup
643     \no@expands
644     \xdef\@tag{#1}%
645     \set@line
646     \ifledRcol \global\insert@countR \z@
647     \else      \global\insert@count \z@ \fi
648     \ignorespaces #2\relax

688       \global\noteschanged@true
689       \xdef\l@d@nums{000|000|000|000|000|000|\edfont@info}%
690     \else
691       \gl@p\line@list\to\@tempb
692       \xdef\l@d@nums{\@tempb|\edfont@info}%
693       \global\let\@tempb=\undefined
694     \fi
695   \fi}
696
```

13   Parallel environments

The initial set up for parallel processing is deceptively simple.

pairs   The `pairs` environment is for parallel columns and the `pages` environment for
pages   parallel pages.

chapterinpages
```
697 \newenvironment{pairs}{%}
698   \l@dpairingtrue
699   \l@dpagingfalse
700 }{%
701   \l@dpairingfalse
702 }
```

The `pages` environment additionally sets the 'column' widths to the `\textwidth`
(as known at the time the package is called). In this environment, there are two
text in parallel on 2 pages. To prevent chapters starting on a lefthand page, the
`\chapter` command is redefined to not clear pages.

```
703 \newenvironment{pages}{%
704   \let\oldchapter\chapter
705   \let\chapter\chapterinpages
706   \l@dpairingtrue
707   \l@dpagingtrue
708   \setlength{\Lcolwidth}{\textwidth}%
709   \setlength{\Rcolwidth}{\textwidth}%
710 }{%
711   \l@dpairingfalse
712   \l@dpagingfalse
713   \let\chapter\oldchapter
714 }
715 \newcommand{\chapterinpages}{\thispagestyle{plain}%
716                 \global\@topnum\z@
717                 \@afterindentfalse
718                 \secdef\@chapter\@schapter}
719
```

ifinstanzaL   These boolean tests are switched by the `\stanza` command, using either the left
ifinstanzaR   or right side.

```
720   \newif\ifinstanzaL
721   \newif\ifinstanzaR
```

Leftside   Within the `pairs` and `pages` environments the left and right hand texts are within
`Leftside` and `Rightside` environments, respectively. The `Leftside` environment
is simple, indicating that right text is not within its purview and using some
particular macros.

```
722 \newenvironment{Leftside}{%
723   \ledRcolfalse
724   \let\beginnumbering\beginnumbering\setcounter{pstartL}{1}
725   \let\pstart\pstartL
726   \let\thepstart\thepstartL
727   \let\pend\pendL
728   \let\memorydump\memorydumpL
729   \Leftsidehook
730   \let\oldstanza\stanza
```

```
731    \renewcommand{\stanza}{\oldstanza\global\instanzaLtrue}
732 }{
733       \let\stanza\oldstanza
734       \Leftsidehookend}
```

\Leftsidehook   Hooks into the start and end of the `Leftside` and `Rightside` environments. These
\Leftsidehookend   are initially empty.
\Rightsidehook
\Rightsidehookend
```
735 \newcommand*{\Leftsidehook}{}
736 \newcommand*{\Leftsidehookend}{}
737 \newcommand*{\Rightsidehook}{}
738 \newcommand*{\Rightsidehookend}{}
739
```

Rightside   The `Rightside` environment is only slightly more complicated than the `Leftside`.
                   Apart from indicating that right text is being provided it ensures that the right
                   right text code will be used.

```
740 \newenvironment{Rightside}{%
741    \ledRcoltrue
742    \let\beginnumbering\beginnumberingR
743    \let\endnumbering\endnumberingR
744    \let\pausenumbering\pausenumberingR
745    \let\resumenumbering\resumenumberingR
746    \let\memorydump\memorydumpR
747    \let\thepstart\thepstartR
748    \let\pstart\pstartR
749    \let\pend\pendR
750    \let\lineation\lineationR
751    \Rightsidehook
752    \let\oldstanza\stanza
753    \renewcommand{\stanza}{\oldstanza\global\instanzaRtrue}
754 }{%
755    \ledRcolfalse
756    \let\stanza\oldstanza
757    \Rightsidehookend
758 }
759
```

14   Paragraph decomposition and reassembly

In order to be able to count the lines of text and affix line numbers, we add an
extra stage of processing for each paragraph. We send the paragraph into a box
register, rather than straight onto the vertical list, and when the paragraph ends
we slice the paragraph into its component lines; to each line we add any notes or
line numbers, add a command to write to the line-list, and then at last send the
line to the vertical list. This section contains all the code for this processing.

14.1 Boxes, counters, \pstart and \pend

\num@linesR Here are numbers and flags that are used internally in the course of the paragraph
\one@lineR decomposition.
\par@lineR

When we first form the paragraph, it goes into a box register, \l@dLcolrawbox or \l@dRcolrawbox for right text, instead of onto the current vertical list. The \ifnumberedpar@ flag will be true while a paragraph is being processed in that way. \num@lines(R) will store the number of lines in the paragraph when it's complete. When we chop it up into lines, each line in turn goes into the \one@line or \one@lineR register, and \par@line(R) will be the number of that line within the paragraph.

```
760 \newcount\num@linesR
761 \newbox\one@lineR
762 \newcount\par@lineR
```

\pstartL \pstart starts the paragraph by clearing the \inserts@list list and other rele-
\pstartR vant variables, and then arranges for the subsequent text to go into the appropriate box. \pstart needs to appear at the start of every paragraph that's to be numbered.

Beware: everything that occurs between \pstart and \pend is happening within a group; definitions must be global if you want them to survive past the end of the paragraph.

We have to have specific left and right \pstart when parallel processing; among other things because of potential changes in the linewidth. The old counters are used to have the good reset of the pstart counters at the begining of the \Pages command.

```
763
764 \newcounter{pstartL}
765 \newcounter{pstartLold}
766 \renewcommand{\thepstartL}{{\bfseries\@arabic\c@pstartL}. }
767 \newcounter{pstartR}
768 \newcounter{pstartRold}
769 \renewcommand{\thepstartR}{{\bfseries\@arabic\c@pstartR}. }
770
771 \newcommand*{\pstartL}{
772 \if@nobreak

```

14.2   Processing one line

For parallel texts we have to be able to process left and right lines independently. For sequential text we happily use the original \do@line. Otherwise . . .

\l@dleftbox   A line of left text will be put in the box \l@dleftbox, and analagously for a line
\l@drightbox   of right text.

```
864 \newbox\l@dleftbox
865 \newbox\l@drightbox
866
```

\countLline   We need to know the number of lines processed.
\countRline
```
867 \newcount\countLline
868    \countLline \z@
869 \newcount\countRline
870    \countRline \z@
871
```

\@donereallinesL   We need to know the number of 'real' lines output (i.e., those that have been input
\@donetotallinesL by the user), and the total lines output (which includes any blank lines output for
\@donereallinesR   synchronisation).
\@donetotallinesR
```
872 \newcount\@donereallinesL
873 \newcount\@donetotallinesL
874 \newcount\@donereallinesR
875 \newcount\@donetotallinesR
876
```

\do@lineL   The \do@lineL macro is called to do all the processing for a single line of left text.

```
877 \newcommand*{\do@lineL}{%

14.5   Pstart number printing in side

The printing of the pstart number is like in ledmac, with two differences :

- Some commands have versions suffixed by R or L.

- The `\affixpstart@num` and `\affixpstart@numR` commands are called in

the `\Pages` command. Consequently, the `pstartL` and `pstartR` counters must be reset at the begining of this command.

```
\affixpstart@numL
\affixpstart@numR 1162
  \leftpstartnumR 1163 \newcommand*{\affixpstart@numL}{%
 \rightpstartnumR 1164 \ifsidepstartnum

14.6   Add insertions to the vertical list

\inserts@listR   \inserts@listR is the list macro that contains the inserts that we save up for
                 one right text paragraph.

```
1228 \list@create{\inserts@listR}
```

\add@insertsR   The right text version.
\add@inserts@nextR
```
1229 \newcommand*{\add@insertsR}{%
1230    \global\let\add@inserts@nextR=\relax
1231    \ifx\inserts@listR\empty \else
1232      \ifx\next@insertR\empty
1233        \ifx\insertlines@listR\empty
1234          \global\noteschanged@true
1235          \gdef\next@insertR{100000}%
1236        \else
1237          \gl@p\insertlines@listR\to\next@insertR
1238        \fi
1239      \fi
1240      \ifnum\next@insertR=\absline@numR
1241        \gl@p\inserts@listR\to\@insertR
1242        \@insertR
1243        \global\let\@insertR=\undefined
1244        \global\let\next@insertR=\empty
1245        \global\let\add@inserts@nextR=\add@insertsR
1246      \fi
1247    \fi
1248    \add@inserts@nextR}
1249
```

14.7   Penalties

\add@penaltiesL   \add@penaltiesL is the last macro used by \do@lineL. It adds up the club,
\add@penaltiesR   widow, and interline penalties, and puts a single penalty of the appropriate size
back into the paragraph; these penalties get removed by the \vsplit operation.
\displaywidowpenalty and \brokenpenalty are not restored, since we have no
easy way to find out where we should insert them.

In the code below, which is a virtual copy of the original \add@penalties,
\num@lines is the number of lines in the whole paragraph, and \par@line is the
line we're working on at the moment. The count \@l@dtempcnta is used to calcu-
late and accumulate the penalty; it is initially set to the value of \ballast@count,
which has been worked out in \do@ballast. Finally, the penalty is checked to see
that it doesn't go below -10000.

```
\newcommand*{\add@penaltiesR}{\@l@dtempcnta=\ballast@count
  \ifnum\num@linesR>\@ne
    \global\advance\par@lineR \@ne
    \ifnum\par@lineR=\@ne
      \advance\@l@dtempcnta by \clubpenalty
    \fi
    \@l@dtempcntb=\par@lineR \advance\@l@dtempcntb \@ne
    \ifnum\@l@dtempcntb=\num@linesR
      \advance\@l@dtempcnta by \widowpenalty
    \fi
    \ifnum\par@lineR<\num@linesR
      \advance\@l@dtempcnta by \interlinepenalty
    \fi
  \fi
    \ifnum\@l@dtempcnta=\z@
      \relax
    \else
      \ifnum\@l@dtempcnta>-10000
        \penalty\@l@dtempcnta
      \else
        \penalty -10000
      \fi
    \fi}
```

This is for a single chunk. However, as we are probably dealing with several chunks
at a time, the above is nor really relevant. I think that it is likely with parallel text
that there is no real need to add back any penalties; even if there was, they would
have to match across the left and right lines. So, I end up with the following.

```
1250 \newcommand*{\add@penaltiesL}{}
1251 \newcommand*{\add@penaltiesR}{}
1252
```

14.8   Printing leftover notes

\flush@notesR   The `\flush@notesR` macro is called after the entire right text has been sliced up and sent on to the vertical list.

```
1253 \newcommand*{\flush@notesR}{%
1254   \@xloop
1255     \ifx\inserts@listR\empty \else
1256       \gl@p\inserts@listR\to\@insertR
1257       \@insertR
1258       \global\let\@insertR=\undefined
1259   \repeat}
1260
```

15   Footnotes

15.1   Outer-level footnote commands

\Afootnote   The outer-level footnote commands will look familiar: they're just called `\Afootnote`, `\Bfootnote`, etc., instead of plain `\footnote`. What they do, however, is quite different, since they have to operate in conjunction with `\edtext` when numbering is in effect.

   If we're within a line-numbered paragraph, then, we tack this note onto the `\inserts@list` list, and increment the deferred-page-bottom-note counter.

```
1261 \renewcommand*{\Afootnote}[1]{%
1262   \ifnumberedpar@
1263     \ifledRcol
1264       \xright@appenditem{\noexpand\vAfootnote{A}%
1265                       {{\l@d@nums}{\@tag}{#1}}}\to\inserts@listR
1266       \global\advance\insert@countR \@ne
1267     \else
1268       \xright@appenditem{\noexpand\vAfootnote{A}%
1269                       {{\l@d@nums}{\@tag}{#1}}}\to\inserts@list
1270       \global\advance\insert@count \@ne
1271     \fi
```

   Within free text, there's no need to put off making the insertion for this note. No line numbers are available, so this isn't generally that useful; but you might want to use it to get around some limitation of ledmac.

```
1272   \else
1273     \vAfootnote{A}{{0|0|0|0|0|0|0}{}{#1}}%
1274   \fi\ignorespaces}

15.2   Normal footnote formatting

The \printlines macro prints the line numbers for a note—which, in the general case, is a rather complicated task. The seven parameters of the argument are the line numbers as stored in \l@d@nums, in the form described on page **??**: the

starting page, line, and sub-line numbers, followed by the ending page, line, and sub-line numbers, and then the font specifier for the lemma.

\printlinesR   This is the right text version of \printlines and takes account of \Rlineflag.
\ledsavedprintlines Just in case, \ledsavedprintlines is a copy of the original \printlines.
          Just a reminder of the arguments:

```
\printlinesR       #1      | #2 |  #3    |   #4     | #5  | #6     |   #7
\printlinesR start-page | line | subline | end-page | line | subline | font
```

```
1415 \def\printlinesR#1|#2|#3|#4|#5|#6|#7|{\begingroup

1427
```

16   Cross referencing

\labelref@listR   Set up a new list, \labelref@listR, to hold the page, line and sub-line numbers for each label in right text.

```
1428 \list@create{\labelref@listR}
1429
```

\edlabel   The \edlabel command first writes a \@lab macro to the \linenum@out file. It then checks to see that the \labelref@list actually has something in it (if not, it creates a dummy entry), and pops the next value for the current label, storing it in \label@refs. Finally it defines the label to be \empty so that any future check will turn up the fact that it has been used.

```
1430 \renewcommand*{\edlabel}[1]{\@bsphack
1431   \ifledRcol
1432     \write\linenum@outR{\string\@lab}%
1433     \ifx\labelref@listR\empty

1570     \else
1571       \xright@appenditem{\noexpand\vbfnoteX{#1}{#2}{\@nameuse{thefootnote#1}}}%
1572                         \to\inserts@list
1573       \global\advance\insert@count \@ne
1574     \fi
1575   \fi\ignorespaces}
1576
```

19   Verse

Like in ledmac, the insertion of hangingsymbol is based on `\ifinserthangingsymbol`, and, for the right side, on `\ifinserthangingsymbolR`.

`\inserthangingsymbolL`
`\inserthangingsymbolR`
```
1577 \newif\ifinserthangingsymbolR
1578 \newcommand{\inserthangingsymbolL}{%
1579 \ifinserthangingsymbol%
1580 \ifinstanzaL%
1581 \hfill\hangingsymbol%
1582 \fi%
1583 \fi}
1584 \newcommand{\inserthangingsymbolR}{%
1585 \ifinserthangingsymbolR%
1586 \ifinstanzaR%
1587 \hfill\hangingsymbol%
1588 \fi%
1589 \fi}
```

When a verse is hanged, the column separator is shifted. To prevent it, the `\do@lineL` and `\do@lineR` commands call `\correcthangingL` and `\correcthangingR` commands. These commands insert horizontal skip which length is equal to the hang indent.

`\correcthangingL`
`\correcthangingR`
```
1590 \newcommand{\correcthangingL}{%
1591 \ifl@dpaging\else%
1592 \ifinstanzaL%
1593 \ifinserthangingsymbol%
1594 \hskip \@ifundefined{sza@0@}{0}{\expandafter%
1595               \noexpand\csname sza@0@\endcsname}\stanzaindentbase%
1596 \fi%
1597 \fi%
```

```
1598 \fi}
1599
1600 \newcommand{\correcthangingR}{%
1601 \ifl@dpaging\else%
1602 \ifinstanzaR%
1603 \ifinserthangingsymbolR%
1604 \hskip \@ifundefined{sza@0@}{0}{\expandafter%
1605            \noexpand\csname sza@0@\endcsname}\stanzaindentbase%
1606 \fi%
1607 \fi%
1608 \fi}
```

Before we can define the main stanza macros we need to be able to save and reset the category code for &. To save the current value we use `\next` from the `\loop` macro.

```
1609   \chardef\next=\catcode`\&
1610   \catcode`\&=\active
1611
```

astanza   This is roughly an environmental form of `\stanza`, which treats its stanza-like contents as a single chunk.

```
1612 \newenvironment{astanza}{%
1613   \startstanzahook
1614   \catcode`\&\active
1615   \global\stanza@count\@ne
1616   \ifnum\usenamecount{sza@0@}=\z@
1617     \let\stanza@hang\relax
1618     \let\endlock\relax
1619   \else
1620 %%%    \interlinepenalty\@M % this screws things up, but I don't know why
1621     \rightskip\z@ plus 1fil\relax
1622   \fi
1623   \ifnum\usenamecount{szp@0@}=\z@
1624     \let\sza@penalty\relax
1625   \fi
1626   \def&{%
1627     \endlock\mbox{}%
1628     \sza@penalty
1629     \global\advance\stanza@count\@ne
1630     \@astanza@line}%
1631   \def\&{%
1632     \endlock\mbox{}
1633     \pend
1634     \endstanzaextra}%
1635   \pstart
1636   \@astanza@line
1637 }{}
1638
```

\@astanza@line   This gets put at the start of each line in the environment. It sets up the paragraph style — each line is treated as a paragraph.

```
1639 \newcommand*{\@astanza@line}{%
1640   \parindent=\csname sza@\number\stanza@count @\endcsname\stanzaindentbase
1641   \par
1642   \stanza@hang%\mbox{}%
1643   \ignorespaces}
1644
```

Lastly reset the modified category codes.

```
1645   \catcode'\&=\next
1646
```

20   Naming macros

The LaTeX kernel provides `\@namedef` and `\@namuse` for defining and using macros that may have non-letters in their names. We need something similar here as we are going to need and use some numbered boxes and counters.

\newnamebox   A set of macros for creating and using 'named'boxes; the macros are called after
\setnamebox   the regular box macros, but including the string 'name'.
\unhnamebox
\unvnamebox
\namebox

```
1647 \providecommand*{\newnamebox}[1]{%
1648   \expandafter\newbox\csname #1\endcsname}
1649 \providecommand*{\setnamebox}[1]{%
1650   \expandafter\setbox\csname #1\endcsname}
1651 \providecommand*{\unhnamebox}[1]{%
1652   \expandafter\unhbox\csname #1\endcsname}
1653 \providecommand*{\unvnamebox}[1]{%
1654   \expandafter\unvbox\csname #1\endcsname}
1655 \providecommand*{\namebox}[1]{%
1656                   \csname #1\endcsname}
1657
```

\newnamecount   Macros for creating and using 'named' counts.
\usenamecount

```
1658 \providecommand*{\newnamecount}[1]{%
1659   \expandafter\newcount\csname #1\endcsname}
1660 \providecommand*{\usenamecount}[1]{%
1661                   \csname #1\endcsname}
1662
```

21   Counts and boxes for parallel texts

In sequential text, each chunk (that enclosed by `\pstart` ... `\pend`) is put into a box called `\raw@text` and then immediately printed, resulting in the box being emptied and ready for the next chunk. For parallel processing multiple boxes are needed as printing is delayed. We also need extra counters for various things.

```
1695 \AtBeginDocument{%
1696   \l@dsetuprawboxes
1697   \l@dsetupmaxlinecounts
1698   \l@dzeromaxlinecounts
1699   \l@dnumpstartsL=\z@
1700   \l@dnumpstartsR=\z@
1701   \l@dpscL=\z@
1702   \l@dpscR=\z@}
1703
```

22   Fixing babel

With parallel texts there is the possibility that the two sides might use different languages via `babel`. On the other hand, `babel` might not be called at all (even though it might be already built into the format).

   With the normal sequential text each line is initially typeset in the current language environment, and then it is output at which time its attachments are typeset (in the same language environment. In the parallel case lines are typeset in their current language but an attachment might be typeset outside the language environment of its line if the left and right side languages are different. To counter this, we have to make sure that the correct language is used at the proper times.

\ifl@dusedbabel   A flag for checking if `babel` has been used as a package.

\l@dusedbabelfalse
\l@dusedbabeltrue
```
1704 \newif\ifl@dusedbabel
1705   \l@dusedbabelfalse
```

\ifl@dsamelang   A flag for checking if the same `babel` language has been used for both the left and
\l@dsamelangfalse   right texts.
\l@dsamelangtrue
```
1706 \newif\ifl@dsamelang
1707   \l@dsamelangtrue
```

\l@dchecklang   I'm going to use `\theledlanguageL` and `\theledlanguageR` to hold the names of
the languages used for the left and right texts. This macro sets `\ifl@dsamelang`
TRUE if they are the same, otherwise it sets it FALSE.

```
1708 \newcommand*{\l@dchecklang}{%
1709   \l@dsamelangfalse
1710   \edef\@tempa{\theledlanguageL}\edef\@temp{\theledlanguageR}%
1711   \ifx\@tempa\@tempb
1712     \l@dsamelangtrue
1713   \fi}
1714
```

\l@dbbl@set@language   In `babel` the macro `\bbl@set@language{⟨lang⟩}` does the work when the language
⟨*lang*⟩ is changed via `\selectlanguage`. Unfortunately for me, if it is given an
argument in the form of a control sequence it strips off the \ character rather than
expanding the command. I need a version that accepts an argument in the form
`\lang` without it stripping the \.

```
1715 \newcommand*{\l@dbbl@set@language}[1]{%
1716   \edef\languagename{#1}%
1717   \select@language{\languagename}%
1718   \if@filesw
1719     \protected@write\@auxout{}{\string\select@language{\languagename}}%
1720     \addtocontents{toc}{\string\select@language{\languagename}}%
1721     \addtocontents{lof}{\string\select@language{\languagename}}%
1722     \addtocontents{lot}{\string\select@language{\languagename}}%
1723   \fi}
1724
```

The rest of the setup has to be postponed until the end of the preamble when we know if `babel` has been used or not. However, for now assume that it has not been used.

\selectlanguage   \selectlanguage is a `babel` command. \theledlanguageL and \theledlanguageR
\l@duselanguage   are the names of the languages of the left and right texts. \l@duselanguage is
\theledlanguageL   similar to \selectlanguage.
\theledlanguageR
```
1725 \providecommand{\selectlanguage}[1]{}
1726 \newcommand*{\l@duselanguage}[1]{}
1727 \gdef\theledlanguageL{}
1728 \gdef\theledlanguageR{}
1729
```

Now do the `babel` fix or `polyglossia`, if necessary.

```
1730 \AtBeginDocument{%
1731   \@ifundefined{xpg@main@language}{%
1732     \@ifundefined{bbl@main@language}{%
```

Either `babel` has not been used or it has been used with no specified language.

```
1733     \l@dusedbabelfalse
1734     \renewcommand*{\selectlanguage}[1]{}}{%
```

Here we deal with the case where babel has been used. \selectlanguage has to be redefined to use our version of \bbl@set@language and to store the left or right language.

```
1735     \l@dusedbabeltrue
1736     \let\l@doldselectlanguage\selectlanguage
1737     \let\l@doldbbl@set@language\bbl@set@language
1738     \let\bbl@set@language\l@dbbl@set@language
1739     \renewcommand{\selectlanguage}[1]{%
1740       \l@doldselectlanguage{#1}%

1819    \ignorespaces
1820      \global\instanzaLfalse
1821      \global\instanzaRfalse}
1822
```

\columnseparator   The separator between line pairs in parallel columns is in the form of a vertical
\columnrulewidth   rule extending a little below the baseline and with a height slightly greater than
the \baselineskip. The width of the rule is \columnrulewidth (initially 0pt so
the rule is invisible).

```
1823 \newcommand*{\columnseparator}{%
1824    \smash{\rule[-0.2\baselineskip]{\columnrulewidth}{1.05\baselineskip}}}}
1825 \newdimen\columnrulewidth
1826    \columnrulewidth=\z@
1827
```

\if@pstarts   \check@pstarts returns \@pstartstrue if there are any unprocessed chunks.
\@pstartstrue   1828 \newif\if@pstarts
\@pstartsfalse 1829 \newcommand*{\check@pstarts}{%
\check@pstarts 1830   \@pstartsfalse
```
1831    \ifnum\l@dnumpstartsL>\l@dpscL
1832      \@pstartstrue
1833    \else
1834      \ifnum\l@dnumpstartsR>\l@dpscR
1835        \@pstartstrue
1836      \fi
1837    \fi
1838 }
1839
```

\ifaraw@text   \checkraw@text checks whether the current Left or Right box is void or not. If
\araw@texttrue one or other is not void it sets \araw@texttrue, otherwise both are void and it
\araw@textfalse sets \araw@textfalse.
\checkraw@text 1840 \newif\ifaraw@text
```
1841    \araw@textfalse
1842 \newcommand*{\checkraw@text}{%
1843    \araw@textfalse
1844    \ifvbox\namebox{l@dLcolrawbox\the\l@dpscL}
1845      \araw@texttrue
1846    \else
1847      \ifvbox\namebox{l@dRcolrawbox\the\l@dpscR}
1848        \araw@texttrue
1849      \fi
1850    \fi
1851 }
1852
```

`\@writelinesinparL`
`\@writelinesinparR` These write the number of text lines in a chunk to the section files, and then afterwards zero the counter.

```
1853 \newcommand*{\@writelinesinparL}{%
1854   \edef\next{%
1855     \write\linenum@out{\string\@pend[\the\@donereallinesL]}}%
1856   \next
1857   \global\@donereallinesL \z@}
1858 \newcommand*{\@writelinesinparR}{%
1859   \edef\next{%
1860     \write\linenum@outR{\string\@pendR[\the\@donereallinesR]}}%
1861   \next
1862   \global\@donereallinesR \z@}
1863
```

24   Parallel pages

This is considerably more complicated than parallel columns.

`\numpagelinesL`
`\numpagelinesR` Counts for the number of lines on a left or right page, and the smaller of the number of lines on a pair of facing pages.
`\l@dminpagelines`
```
1864 \newcount\numpagelinesL
1865 \newcount\numpagelinesR
1866 \newcount\l@dminpagelines
1867
```

`\Pages` The `\Pages` command results in the previous Left and Right texts being typeset on matching facing pages. There should be equal numbers of chunks in the left and right texts.

```
1868 \newcommand*{\Pages}{%
1869   \setcounter{pstartL}{\value{pstartLold}}
1870   \setcounter{pstartR}{\value{pstartRold}}
1871   \typeout{}
1872   \typeout{*************************** PAGES ***************************}
1873   \ifnum\l@dnumpstartsL=\l@dnumpstartsR\else
1874     \led@err@BadLeftRightPstarts{\the\l@dnumpstartsL}{\the\l@dnumpstartsR}%
1875   \fi
```

Get onto an empty even (left) page, then initialise counters, etc.

```
1876   \cleartol@devenpage
1877   \begingroup
1878     \l@dzeropenalties
1879     \endgraf\global\num@lines=\prevgraf
1880              \global\num@linesR=\prevgraf
1881     \global\par@line=\z@
1882     \global\par@lineR=\z@
1883     \global\l@dpscL=\z@
1884     \global\l@dpscR=\z@
1885     \writtenlinesLfalse
1886     \writtenlinesRfalse
```

Check if there are chunks to be processed.

```
1887        \check@pstarts
1888        \loop\if@pstarts
```

Loop over the number of chunks, incrementing the chunk counts (`\l@dpscL` and `\l@dpscR` are chunk (box) counts.)

```
1889        \global\advance\l@dpscL \@ne
1890        \global\advance\l@dpscR \@ne
```

Calculate the maximum number of real text lines in the chunk pair, storing the result in the relevant `\l@dmaxlinesinpar`.

```
1891        \getlinesfromparlistL
1892        \getlinesfromparlistR
1893        \l@dcalc@maxoftwo{\@cs@linesinparL}{\@cs@linesinparR}%
1894            {\usenamecount{l@dmaxlinesinpar\the\l@dpscL}}%
1895        \check@pstarts
1896      \repeat
```

Zero the counts again, ready for the next bit.

```
1897        \global\l@dpscL=\z@
1898        \global\l@dpscR=\z@
```

Get the number of lines on the first pair of pages and store the minumum in `\l@dminpagelines`.

```
1899        \getlinesfrompagelistL
1900        \getlinesfrompagelistR
1901        \l@dcalc@minoftwo{\@cs@linesonpageL}{\@cs@linesonpageR}%
1902          {\l@dminpagelines}%
```

Now we start processing the left and right chunks (`\l@dpscL` and `\l@dpscR` count the left and right chunks), starting with the first pair.

```
1903        \check@pstarts
1904        \if@pstarts
```

Increment the chunk counts to get the first pair.

```
1905        \global\advance\l@dpscL \@ne
1906        \global\advance\l@dpscR \@ne
```

We haven't processed any lines from these chunks yet, so zero the respective line counts.

```
1907        \global\@donereallinesL=\z@
1908        \global\@donetotallinesL=\z@
1909        \global\@donereallinesR=\z@
1910        \global\@donetotallinesR=\z@
```

Start a loop over the boxes (chunks).

```
1911        \checkraw@text
1912 %       \begingroup
1913 {         \loop\ifaraw@text
```

See if there is more that can be done for the left page and set up the left language.

```
1914              \checkpageL
1915              \l@duselanguage{\theledlanguageL}%
1916 %%%          \begingroup
1917 {            \loop\ifl@dsamepage
1918
```

Process the next (left) text line, adding it to the page.

```
1919              \do@lineL
1920              \advance\numpagelinesL \@ne
1921              \ifshiftedverses
1922              \ifdim\ht\l@dleftbox>0pt\hb@xt@ \hsize{\ledstrutL\unhbox\l@dleftbox}\fi%
1923              \else
1924              \hb@xt@ \hsize{\ledstrutL\unhbox\l@dleftbox}%
1925              \fi
```

Perhaps we have to move to the next (left) box. Check if we have got all we can onto the page. If not, repeat for the next line.

```
1926
1927              \get@nextboxL
1928              \checkpageL
1929            \repeat
```

That (left) page has been filled. Output the number of real lines on the page — if the page break is because the page has been filled with lines, use the actual number, otherwise the page has been ended early in order to synchronise with the facing page so use an impossibly large number.

```
1930              \ifl@dpagefull
1931              \@writelinesonpageL{\the\numpagelinesL}%
1932              \else
1933              \@writelinesonpageL{1000}%
1934              \fi
```

Zero the left page lines count and clear the page to get onto the facing (odd, right) page.

```
1935              \numpagelinesL \z@
1936              \clearl@dleftpage }%
```

Now do the same for the right text.

```
1937              \checkpageR
1938              \l@duselanguage{\theledlanguageR}%
1939 {            \loop\ifl@dsamepage

¡/code¿

A   Examples

This section presents some sample documents.

The figures are from processed versions of the files. Having latexed a file I used DVIPS to get Encapsulated PostScript, then the epstopdf script to get a PDF version as well, for example:

```
> latex villon
> latex villon
> latex villon
> dvips -E -o villon.eps villon  % produces villon.eps
> epstopdf villon.eps            % produces villon.pdf
```

For a multipage example, DVIPS has an option to output a range of pages (-p for the first and -l (letter l) for the last). For instance, to output a single page, say page 2:

```
> latex djd17nov
> latex djd17nov
> latex djd17nov
> dvips -E -p2 -l2 -o djd17novL.eps djd17nov  % produces djd17novL.eps
> epstopdf djd17novL.eps                       % produces djd17novL.pdf
```

For those who aren't fascinated by LaTeX code, I show the all the typeset results first, then the code that produced them.

I thought that limericks were peculiarly English, but this appears not to be the case. As with most limericks this one is by Anonymous.

Il y avait un jeune homme de Dijon,	There was a young man of Dijon, 1
2 Qui n'avait que peu de religion.	Who had only a little religion,
Il dit: 'Quant à moi,	He said: 'As for me, 3
4 Je déteste tous les trois,	I detest all the three,
Le Père, et le Fils, et le Pigeon.'	The Father, the Son, and the Pigeon.' 5

The following is verse LXXIII of François Villon's *Le Testament* (The Testament), composed in 1461.

Dieu mercy et Tacque Thibault,	Thanks to God — and to Tacque Thibaud
2 Qui tant d'eaue froid m'a fait boire,	Who made me drink so much cold 2r water,
Mis en bas lieu, non pas en hault,	Put me underground instead of higher up
4 Mengier d'angoisse maints poire,	And made me eat such bitter fruit, 4r
Enferré ... Quant j'en ay memoire,	In chains ... When I think of this,
6 Je Prie pour luy *et reliqua*,	I pray for him—*et reliqua;* 6r
Que Dieu luy doint, et voire, voire!	May God grant him (yes, by God)
8 Ce que je pense ... *et cetera.*	What I think ... *et cetera.* 8r

The translation and notes are by Anthony Bonner, *The Complete Works of François Villon*, published by Bantam Books in 1960.

---

4 poire d'angoisse] This has a triple meaning: literally it is the fruit of the choke pear, figuratively it means 'bitter fruit', and it also refers to a torture instrument.
6 *et reliqua*] and so on

1r Tacque Thibaud] A favourite of Jean, Duc de Berry and loathed for his exactions and debauchery. Villon uses his name as an insulting nickname for Thibaud d'Auxigny, the Bishop of Orléans.
2r cold water] Can either refer to the normal prison diet of bread and water or to a common medieval torture which involved forced drinking of cold water.

6–7 William is confusing two charters that are five years apart. Permission from St. Apostles' Church in Cologne had been obtained as early as 1249. Cf. Sloet, *Oorkondenboek* nr. 707 (14 November 1249): "... nos devotionis tue precibus annuentes, ut ipsam ecclesiam faciens demoliri transferas in locum alium competentem, tibi auctoritate presentium indulgemus..." 11–19 Cf. Sloet, *Oorkondenboek* nr. 762 (June 1254)

2

Figure 2: Left page output from `djd17nov.tex`.

1 St. Stephen's Church in Nijmegen

After the noble count Otto had taken in pledge the power over Nijmegen,[1] like
I have written above, he wanted to protect the town. So in June 1254 he and   1254
the judge, the sheriffs and other citizens of Nijmegen obtained permission to
demolish the parish church that lay outside the town walls,[2] to move it inside
5 the walls and to rebuild it new. This operation was necessary and useful both for
Otto himself and for the inhabitants of the town. The reverend father Conrad of
Hochstaden, archbishop of Cologne,[3] gave his permission. So did the reverend
dean and canons of the chapter of St. Apostles' in Cologne, who had long[4] been
the true and benevolent patrons of the church—but they did not allow Otto to
10 do anything without their knowledge, nor to infringe their rights, nor to damage
their property.

And so the count and the town voluntarily gave an open space in town called
Hundisburg, which was owned by the aforementioned king William, to the dean
and chapter of St. Apostles' in order to build and consecrate a church and grave-
15 yard. King William approved and the town of Nijmegen explicitly expressed its
assent. A new ditch was dug on property of the church near the castle and the
harbour,[5] causing the demolition of the presbytery. In compensation, the count
and citizens committed themselves to giving the parish priest another suitable
space close enough to the new church that was about to be built. A letter about
20 these transactions, with the seals of count Otto and the town of Nijmegen, is
kept at St. Apostles' church.[6]

// One additional line to show synchronization. //

---

[1]In 1247 William II (1227–1256) count of Holland needed money to fight his way to Aachen
to be crowned King of the Holy Roman Empire. He gave the town of Nijmegen in pledge to
Otto II (1229–1271) count of Guelders.

[2]Since the early seventh century old St. Stephen's church had been located close to the
castle, at today's Kelfkensbos square. Traces of the church and the presbytery were found
during excavations in 1998–1999.

[3]Conrad of Hochstaden († 1261) was archbishop of Cologne in 1238–1261. Nijmegen be-
longed to the archdiocese of Cologne until 1559.

[4]They probably became the patrons when the chapter was established in the early eleventh
century. About the church and the chapter, see Gottfried Stracke, *Köln: St. Aposteln*, Stadt-
spuren – Denkmäler in Köln, vol. 19, Köln: J. P. Bachem, 1992.

[5]Nowadays, the exact location of the medieval ditch—and of two Roman ones—can be
seen in the pavement of Kelfkensbos square.

[6]The original letter is lost. A 15th century transcription of it is kept at the Historisches
Archiv der Stadt Köln (HAStK).

3

2486
```

2487 `\noindent\setline{1}%`
2488 *After the noble count Otto had taken in pledge the power over*
2489 *Nijmegen,\footnote{In 1247 William II\protect\index{William II of Holland}*
2490 *(1227--1256) count of Holland needed money to fight his way to*
2491 *Aachen\protect\index{Aachen} to be crowned King of the Holy Roman*
2492 *Empire. He gave the town of Nijmegen in pledge to Otto*
2493 *II\protect\index{Otto II of Guelders} (1229--1271) count of Guelders.}*
2494 *like I have written above, he wanted to protect the town. So in June*
2495 *1254\ledsidenote{1254} he and the judge, the sheriffs and other*
2496 *citizens of Nijmegen obtained permission to demolish the parish*
2497 *church that lay outside the town walls,\footnote{Since the early*
2498 *seventh century old St.\ Stephen's church had been located close*
2499 *to the castle, at today's*
2500 *Kelfkensbos\protect\index{Kelfkensbos (Nijmegen)} square.*
2501 *Traces of the church and the presbytery were found during excavations*
2502 *in 1998--1999.} to move it inside the walls and to rebuild it new.*
2503 *This operation was necessary and useful both for Otto himself and*
2504 *for the inhabitants of the town. The reverend father Conrad of*
2505 *Hochstaden, archbishop of*
2506 *Cologne,\footnote{Conrad of Hochstaden ({\textdagger} 1261) was*
2507 *archbishop of Cologne in 1238--1261. Nijmegen belonged to the*
2508 *archdiocese of Cologne until 1559.} gave his permission. So did the*
2509 *reverend dean and canons of the chapter of St.*
2510 *Apostles'\protect\index{St. Apostles' (Cologne)} in Cologne, who had*
2511 *long\footnote{They probably became the patrons when the chapter was*
2512 *established in the early eleventh century. About the church and the*
2513 *chapter, see Gottfried Stracke\protect\index{Stracke, G.},*
2514 *\textit{K\"{o}ln:\ St.\ Aposteln}, Stadtspuren -- Denkm\"{a}ler in*
2515 *K\"{o}ln, vol.\ 19, K\"{o}ln: J.\,P.\ Bachem, 1992.} been the true*
2516 *and benevolent patrons of the church---but they did not allow Otto*
2517 *to do anything without their knowledge, nor to infringe their rights,*
2518 *nor to damage their property.*
2519 `\pend`
2520
2521 `\pstart`
2522 *And so the count and the town voluntarily gave an open space in town*
2523 *called Hundisburg, which was owned by the aforementioned king William,*
2524 *to the dean and chapter of St.\ Apostles' in order to build and*
2525 *consecrate a church and graveyard. King William approved and the*
2526 *town of Nijmegen explicitly expressed its assent. A new ditch was dug*
2527 *on property of the church near the castle and the*
2528 *harbour,\footnote{Nowadays, the exact location of the medieval*
2529 *ditch---and of two Roman ones---can be seen in the pavement of*
2530 *Kelfkensbos\protect\index{Kelfkensbos (Nijmegen)} square.} causing*
2531 *the demolition of the presbytery. In compensation, the count and*
2532 *citizens committed themselves to giving the parish priest another*
2533 *suitable space close enough to the new church that was about to be*
2534 *built. A letter about these transactions, with the seals of count*
2535 *Otto and the town of Nijmegen, is kept at St.\ Apostles'*
2536 *church.\footnote{The original letter is lost. A 15th century*

A.3   Example poetry on parallel facing pages

This example, illustrated in Figures 4 to 7, was originally provided in November
2004 by Dirk-Jan Dekker for an earlier version of ledpar. I have updated it, and
also extended it to show the difference between the \stanza command and the
astanza environment. \stanza is used for the first pair of pages and astanza for
the second pair. Note the definition of \endstanzaextra to give a short line after
each stanza.

```

Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.

Change History

v0.4

    General: No more ledparpatch. All patches are now in the main file. 1

v0.5

    General: Corrections about `\section` and other titles in numbered sections 1

v0.6

    General: Be able to us `\chapter` in parallel pages. 1

v0.7

    General: Option 'shiftedverses' which make there is no blank between two parallel verses with inequal length. 1

v0.8

    General: Possibility to have a symbol on each hanging of verses, like in the french typography. Redefine the commande `\hangingsymbol` to define the character. 1

v0.9

    `\ifledRcol`: Moved `\iflledRcol` and `\ifnumberingR` to ledmac   13

    General: Possibility to number `\pstart`. 9

    Possibilty to number the pstart with the commands `\numberpstarttrue`. 1

v0.9.1

    General: The numbering of the pstarts restarts on each `\beginnumbering`. 1

v0.9.2

    General: Debug : with `\Columns`, the hanging indentation now runs on the left columns and the hanging symbol is shown only when `\stanza` is used. . . . 1

v0.9.3

    General: `\thepstartL` and `\thepstartR` use now `\bfseries` and not `\bf`, which is deprecated and makes conflicts with memoir class. . . . 1
